1. Executive Summary

Quanta Scout OS is an AI-native venture scout intelligence platform built to close the gap between how scouts naturally share information and how investment teams actually need to receive it.

Scouts submit startup leads the way they would text a colleague — conversationally, with voice, documents, or a quick form. The system structures that input, identifies what's missing, follows up automatically, and delivers a clean, signal-rich deal record to the Quanta team.

The product has two distinct experiences:

	Scout App	Quanta Team Dashboard
Design focus	Mobile-first, frictionless	Desktop, analytical
Primary action	Submit leads, reply to Quanta	Review deals, triage, follow up
AI role	Intake, structure, next-question	Signals, brief, market analysis
Core principle	Feels like texting Quanta	Structured investment workflow

The system is not a CRM. It is a scout engagement and investment intelligence layer — one that scouts actually want to use and that gives the Quanta team the right information at the right time.

2. Demo Access

App URL: <https://quanta-scout-os.vercel.app>

Quanta Team Login

Email: team@quanta.vc

Password: Quanta@123

→ Lands on the internal Deal Inbox dashboard.

Scout Login

Email: atharvanimbalkar36@gmail.com

Password: Atharva@29

→ Lands on the Scout Portal home.

Email Note: The app uses [Resend](#) for transactional email. The Resend account is currently in test mode with no verified sending domain attached. As a result, outbound emails only deliver to `atharvanimbalkar36@gmail.com`. Example app emails (check-in, invite, follow-up) are included as a separate attachment for reference.

3. Product Architecture

4. Agent Responsibilities

Agent	Purpose	Input	Output
Scout Intake Agent	Converts conversational scout input into a structured startup record	Raw text, voice transcript, or form fields	Populated deals record with name, description, category, stage
Extraction Agent	Identifies and extracts key startup data; flags missing fields	Deal record + scout messages	Structured fields; <code>missing_info_tasks</code> for gaps

Signal Extraction Agent	Generates qualitative VC signals — no numeric scores	Deal context, Q&A, founder data, traction	founder_signal, market_signal, traction_signal, scout_conviction — each with level (strong / medium / early / weak) and evidence
Market Analysis Agent	Produces a full market deep-dive on demand	Deal + signal context	Market overview, TAM/SAM estimates, tailwinds/headwinds, comparable companies, investment thesis, diligence questions
Internal Briefing Agent	Creates a clean, investor-ready deal summary	Deal context + signals	what_it_does, why_it_may_matter, known facts, open questions, suggested next action
Follow-up Agent	Tracks promised information and triggers reminders	missing_info_tasks with due dates	Reminder emails to scouts; updates task status
Partner Question Agent	Rewrites internal team questions into scout-friendly messages	Raw partner question text	Rewritten message suitable for the scout's communication style

All agents use Groq-hosted Llama 3 models. Structured outputs use JSON mode. Plain text outputs (check-in messages, liaison replies) use standard completions. All outputs are saved to `ai_outputs` for auditability.

5. Scout Flow

The scout experience is designed to feel like texting Quanta — not filling out a CRM. Every step is optimised for mobile and short sessions.

Name, description, founder details

|

[AI Review + Q&A]

- System asks ONE follow-up question at a time
- Scout answers in natural language
- Missing info flagged automatically

|

[Personal Notes]

- Voice or text note (private to scout)

|

[Submit]

- Post-submission pipeline runs in background
- Scout sees confirmation; deal appears in their list

|

[Startup Detail Page]

- Overview tab: deal info, rating, submitted answers
- Interaction tab: live chat thread with AI/Quanta
 - "Still needed" banner shows outstanding items
 - Scout can reply, upload, or answer inline

Key design principle: The scout never navigates a CRM. They see their startups, reply to messages, and upload when asked. The system handles structure, follow-up, and routing.

6. Quanta Team Flow

The Quanta dashboard is optimised for desktop review. It is designed for speed — triage in seconds, deep-dive when needed, and a direct line to the scout when something is worth pursuing.

[Login as team@quanta.vc]

|

[Deal Inbox]

- Filtered list of submitted deals
- Status badges: Submitted / Needs Info / Under Review / Intro Requested
- Priority flags, scout name, signal level visible at a glance

|

[Deal Detail – Overview Tab]

- AI Brief (auto-generated): what it does, why it matters, known facts, open questions, suggested next action
- Signal Cards: Founder / Market / Traction / Scout Conviction
 - qualitative levels, not scores
- Scout Q&A thread: all questions and answers in one view
- Missing info tasks with due dates
- Founder cards with LinkedIn
- Uploaded files and voice pitches
- Internal notes (visible only to Quanta team)

7. Email System

All emails are sent via **Resend** using the `onboarding@resend.dev` sender address (Resend's free-tier shared domain).

Email Type	Trigger	Recipient	Content
Scout Invite	Quanta team adds a scout via dashboard	New scout email	Personalised welcome + one-click signup link (7-day expiry)
Weekly Check-in	Cron job — every Saturday 9am UTC	All active scouts	AI-personalised message + Yes / No / Submit CTA buttons
Follow-up Reminder	Follow-up Agent — when task is overdue	Scout who made the commitment	Specific reminder of the promised item + deadline
Manual Reminder	Quanta team clicks check-in on scout row	That scout	Quick "seen anything interesting?" email with Yes / No buttons

Resend limitation for this demo: Without a verified sending domain, Resend restricts delivery to the account owner's email only (atharvanimbalkar36@gmail.com). In production, attaching a verified domain (e.g. scout@quantaventures.com) removes this restriction and enables delivery to all scouts. Example emails are included separately.

8. Data Model

Table	Description
scouts	Scout profiles — name, email, focus areas, responsiveness score, activity timestamps
deals	Core startup records — name, description, category, stage, status, priority, conviction
founders	Founder records linked to a deal — name, LinkedIn, background, email
deal_messages	Full conversation thread per deal — scout, AI, and Quanta messages with timestamps
deal_files	Uploaded documents and audio files — storage URL, extracted text, AI summary
missing_info_tasks	Tracked gaps — what's needed, who committed, expected and follow-up dates
ai_outputs	All AI agent outputs — type, model, input snapshot, output JSON (auditable)
partner_questions	Questions from the Quanta team — original and AI-rewritten versions, sent/answered status
internal_notes	Quanta-only notes on a deal — not visible to scouts
scout_invites	Pending invite tokens — email, expiry, acceptance status
email_correspondence	Log of all outbound emails — type, Resend message ID, sent and response timestamps

All tables use UUID primary keys. Row-level security is enabled on user-facing tables. The Quanta team dashboard uses the Supabase service role (bypasses RLS). Scout-facing routes use the authenticated user session.

9. Demo Walkthrough Script

Estimated time: 5–7 minutes

Act 1 — Scout Experience (2 min)

1. Log in as Scout → Go to [quanta-scout-os.vercel.app](#) → Select **Scout** tab · enter `atharvanimbalkar36@gmail.com` / `Atharva@29` → Scout home shows submitted startups and any pending follow-ups.

2. Add a Startup → Tap **+ Add Startup** → Choose **Manual** entry (or try **Voice** to demo Groq Whisper transcription) → Fill in a startup name, one-liner, founder name → The system asks a single follow-up

question — answer it naturally → Add a quick personal note via voice or text

3. Submit → Hit **Submit** — deal is marked submitted, multi-agent pipeline runs in background → Navigate into the startup detail → Show the **Interaction** tab — Q&A thread visible, "Still needed" banner showing open items

Act 2 — Quanta Team Experience (3 min)

4. Switch to Team Login → Log out, select **Quanta Team** tab · enter `team@quanta.vc / Quanta@123` → Deal Inbox loads — the submitted deal is visible with status badge

5. Open the Deal → Click the deal card → **Overview tab** loads:

- AI Brief auto-generates (30–45 sec on first load)
- Signal cards show qualitative levels with evidence
- Scout Q&A answers are threaded below
- Missing info tasks visible in the sidebar

6. Analyze Tab → Click **Analyze** → **Run Analysis** → Wait ~20 seconds for Groq to generate:

- Market overview with TAM/SAM
- Tailwinds and headwinds
- Comparable companies
- Investment thesis
- AI-chosen charts

7. Ask the Scout a Follow-up → Click **Interaction** tab → Type a raw question (e.g. "Do they have any LOIs or pilot customers?") → Click **Rewrite** — AI rewrites into scout-friendly language → Click **Send** — message appears in the thread; scout sees it in their portal

8. Scout Management + Email → Navigate to **Scouts** in the sidebar → Show the scout list with responsiveness scores → Hover a row and click the envelope icon — sends a check-in email to that scout → Point out the **Send Check-in to All** button for bulk outreach

10. Final Notes

What this system is not

This is not a submission form. It is not a CRM. It is a scout engagement and investment intelligence workflow.

The core product insight

Most VC scout systems fail at the same place: the gap between how scouts naturally talk about deals and the structured data an investment team needs to make decisions.

Quanta Scout OS closes that gap with two dedicated experiences:

For scouts — submit anything, any way, on mobile. The system handles structure, follow-up, and routing. Scouts feel like they are texting Quanta, not filing a report.

For the Quanta team — every deal arrives pre-structured, with qualitative signals, an investor-ready brief, open questions surfaced, and a direct line to the scout. Triage takes seconds. Deep research is one click away.

Key design decisions

- **No numeric scores** — signals are qualitative (`strong` / `medium` / `early` / `weak`) to avoid false precision
- **One question at a time** — the AI never interrogates the scout; it asks one thing and waits
- **Background pipeline** — all AI processing is non-blocking; scouts and team never wait for agents
- **Full auditability** — every AI output is logged with its input snapshot in `ai_outputs`
- **Email-first follow-up** — scouts respond to emails with one click; no portal login required for simple responses
